Abstract The purpose of this study was to determine whether there were differences in the prevalence of risk factors for coronary artery disease between men who had been exposed to asbestos and those who had not. A case-control study was conducted among men aged 60 years or older who had been employed in asbestos-related occupations for at least 10 years. The prevalence of risk factors for coronary artery disease was compared between men who had been exposed to asbestos and those who had not. The results showed that men who had been exposed to asbestos had a higher prevalence of risk factors for coronary artery disease than those who had not. The prevalence of smoking, hypertension, and diabetes mellitus was significantly higher in the exposed group. The prevalence of hyperlipidemia was also higher in the exposed group, although it did not reach statistical significance. The results suggest that exposure to asbestos may be associated with an increased prevalence of risk factors for coronary artery disease.

As required by 37 CFR 3.7(b)(1)(ii), the documentary evidence of the chain of title from the original owner to the assignee was, or concurrently is being, submitted for recordation pursuant to 37 CFR 3.11.

[N-21E] A separate copy (i.e., a true copy of the original assignment document(s)) must be submitted to Assignment Division in accordance with 37 CFR Part 3, to reflect the assignment in the records of the USPTO. See MPEP § 302.06.

The undersigned hereby, in full satisfaction, is authorized to act on behalf of the assignor.
